TITLE: Hermetic electric pump. Class 59, No. 186862. [announced by the All-Union Scientific Research Institute for Rural Electrification (Vsesoyuznyy nauchno-issledovatel'skiy institut elektrifikatsii sel'skogo khozyaystva)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 19, 1966, 130-131

TOPIC TAGS: ~~машиностроение~~ engineering, fluid pump, hydraulic pump, electric motor

ABSTRACT: An Author Certificate has been issued for a hermetic electric pump consisting of a housing containing a pump and an electric-drive motor with an outer rotor and a female stator, the pump is cooled by a part of the fluid which is transferred from the discharge to the suction nozzle. To simplify design and intensify cooling, the pump's working members are located on the surface of the rotor or of the rotor and the electric-motor housing, and the winding of the stator is designed for the direct transfer of the cooling flow through the stator's slots. AUTHOR: Slavin, S.

TITLE: The Kabanov Effect

PERIODICAL: Radio, 1961, No.2, p.6

TEXT: On the night of October 10, 1946 Candidate of Technical Sciences N. I. Kabanov succeeded in obtaining very weak reflections of radar signals from the Draconid meteor shower which at the time passed near the Earth. On the basis of the radar echoes, the distance of this shower was about 300 km from the surface of the Earth. Later on, Kabanov succeeded in obtaining echoes from the ionized trails of meteor showers at distances of about 1000 km. Kabanov argued that if radiowaves are reflected by meteor trails from such considerable distances, it is obviously possible that after bouncing back to Earth from the ionosphere a fraction of the energy will eventually return from the point of destination to the transmission point. Theoretical analysis and calculations have supported this hypothesis and, in fact, a radio locator operating in the UHF range did receive signals which bounced back from a point on the Earth 2000 km away from the transmitter. Kabanov concluded

The Kabanov Effect

that this technique would enable "seeing" over long distances by means of "ionosphere radio location". Kabanov prepared a detailed report on this topic in 1947. In November, 1960 the Chairman of the State Committee on Inventions and Discoveries, A. F. Garmashev, presented to Kabanov a certificate No.1 in which the "Kabanov Effect" is defined as follows: "radiowaves reflected from the ionosphere will partly scatter after bouncing onto the Earth's surface but a certain fraction of the scattered energy will bounce back to the source of radiation where it can be recorded". The importance of this discovery can hardly be over estimated, since it can be used for probing the ionosphere at various angles and is a new method of investigating the ionosphere and radio propagation. The Kabanov effect enables determining the conditions of passage of radiowaves and to select more accurately optimum frequencies for radio communication with particular geographical regions. Theoretically it is possible to reach any corner of the globe by appropriate selection of the frequency and the direction of transmission; the curvature of the Earth will no longer be an obstacle to radio location. Kabanov stated that radio amateurs can definitely assist

in probing this phenomenon, using relatively simple equipment, for instance, aerials of the "wave channel" type and pulse generation equipment for the transmitter with CRT connected to the receiver output. Amateurs will be able to receive their own signals from distances of a few hundreds to many thousands of kilometres. By changing the frequency, radio amateurs will be able to communicate more efficiently with selected regions of the Earth. The most favourable time for receiving the reflected signals is from sunset to sunrise.

PURPOSE: The book is intended for readers interested in the Soviet Arctic.

COVERAGE: The present volume, the second of a series of three, is a collection of 27 articles by various authors presenting an historical account of the exploration and economic development of the Soviet North. A small part of the book is devoted to Arctic areas beyond the confines of the Soviet Union. The aim of the book is to contribute to an understanding of the physical geography, cartography, ethnography, and economy of the Soviet North through a historical survey of these factors, a large number of authors, explorers, scientists, travellers, pilots, navigators, etc., are cited.

TITLE: Approximate Calculation of the Mean Energy of Electrons
Knocked out by Gamma Rays in an Ionization Chamber 19

PERIODICAL: Atomnaya energiya, 1960, Vol. 9, No. 2, pp. 135-136

TEXT: An ionization chamber is better suited than a phosphor for various technical purposes such as measuring the thickness and density of materials. The low efficiency of ionization chambers for gamma radiation may be increased by various means. Mostly, this is done by coating the inner surface of the chamber with lead and by using multi-layer high-voltage collector electrodes. As an exact calculation of the ionization current meets with considerable difficulties, an approximation method is suggested here, which is based upon the knowledge of the mean energy of the electrons knocked out by gamma quanta. For this purpose, the authors used published theoretical and experimental data concerning the gamma radiation of Co^{60} and Cs^{137} . The geometry of the experiment theoretically dealt with in this paper is illustrated by a schematical drawing. The values obtained show that the

TITLE: History of Geological Study of Western Ukraine
(Istoriya geologicheskogo izucheniya zapadnykh oblastey
Ukrainy)

PERIODICAL: V sb: Ocherki po istorii geol. znaniy. Nr 4, Moscow,
Iz-vo AN SSSR, 1955, pp 70-103

APSTRACT: The history of geological studies in the western
reaches of the Ukraine, as presented in this article,
is divided into four geological provinces: the south-
western periphery of the Russian Platform; the Car-
pathian peripheral flexure; the geosynclinal Carpathian
district; and the trans-Carpathian district. Basic
work dealing with the first of these districts was
carried out in the pre-Soviet era, mainly by Polish
and the Rumanian geologists. The article presents the

Card 1/5

15-57-2-1199

History of Geological Study of Western Ukraine (Cont.)

names of several scientists and gives the dates on which they made their scientific discoveries, principally stratigraphic in nature. The list starts with the works of Staszyc (1805). During the Soviet period, which started in Podolia and Volynia in 1939 and in the district of Chernovy in 1945, geological investigations began to be conducted on a larger scale. The discovery and the description of the structure of the L'vov region represent the most significant achievement of Soviet investigations. Correct solution of the geological problems soon led to the discovery and the quantitative estimate of a large number of mineral resources (hard coal, gypsum, phosphorites, bentonite clays). The district of the Carpathian peripheral flexure attracted the attention of investigators for a long time because of its deposits of salt, petroleum, and ozocerite. Austrian Geological Service conducted a geological survey of Galiciato the scale of 1:75 000 between 1887 and 1911. In the same period one of the first Miocene sections of the cis-Carpathian region was compiled, the thrust of the Carpathian flysch onto the salt-bearing cis-Carpathian Miocene was

Card 2/5

15-57-2-1199

History of Geological Study of Western Ukraine (Cont.)

ascertained, and the lead-zinc ores of Truskawiec were described. Starting with 1929, the published works of the Carpathian Geological Institute began to make their appearance, but they were discontinued with the publication of the geological map of the Western Carpathian Mountains to the scale of 1:200 000. During the Soviet Period an important part in the solution of geological problems dealing with the development of the flexure was contributed by the works of V. I. Slavin (1947), A. Ye. Mikhalov (1951), and others. Soviet geologists discovered three salt-bearing series, evaluated practical significance of the gas, oil and salt deposits, and found a number of new valuable minerals. The geosynclinal Carpathian district or, more exactly, the northern slopes of the Carpathian Mountains from the district of Drohobych to that of Stanislavov was studied mainly by Polish geologists; the region of Chernovtsy, by Austrian and Rumanian geologists. The history of studies on the southern Carpathian slopes in the trans-Carpathian district was much more complex. The pre-Soviet period of geological

TITLE: Kanev Dislocations in Dnepr District (Kanevskiy
dislokatsii v Pridneprov'ye)

PERIODICAL: Uch. zap. Kazansk. gos. un-ta, 1956, Vol 115, Nr 10,
pp 129-130

ABSTRACT: The author describes the Kanev dislocations on the right
bank of the Dnepr 100 km from Kiyev. Data on the
character of the folds of discontinuous fractures and
their depth are given. The petrographic composition of
the deposits is recorded. On the basis of the recent
investigations, the author concurs with the opinion that
the formation of the Kanev dislocations is related to
exogenous factors--landslides and glaciers. The
dislocated zone does not exceed 200 m in thickness.
The folded forms do not extend far in depth.

TITLE: Discovery of Triassic Deposits at the Southern Slope of the Great Caucasus (O nakhozhdenii triasovykh otlozheniy na yuzhnom sklone Bol'shogo Kavkaza)

PERIODICAL: Doklady AN SSSR, 1957, Vol. 117, Nr 3, pp. 483-485 (USSR)

ABSTRACT: Up to now, no Triassic Deposits were known, although their possible occurrence was not denied theoretically. During the years 1955-1956 the author has investigated the upper part of the catchment area of the Mzymta-river and at its right bank near the village Estonskoye he described a rock exposure consisting of 5 layers. Within the limes (layers 2 and 5) there occur solitary and colonial corals Margarosmia sp. and Thamnostraea meriani var. Reus. The mentioned species are characteristic for the Upper Triassic, the genus Thamnostraea is widely distributed within the "Noric" limes of the northern slope of the Bol'shoy Kavkaz. The Triassic age of these deposits is additionally confirmed by the transgressive bedding of the basal layers of the Lower Liassic upward the left bank of the Mzymta-river. The Pre-Jurassic age of the limes of the Estonskoye is distinctly expressed by the characteristic

Card 1/3

Discovery of Triassic Deposits at the Southern Slope ~~20-3-35/52~~
of the Great Caucasus

evidence of a mighty flexure at that epoch. Parallels may be drawn between the Triassic sediments of the southern slope and the Triassic of the Krym. The Triassic sediments, apparently, are distributed widely at the southern slope of the western part of the Bol'shoy Kavkaz, however, they difficultly can be jointed and separated, because indicating horizons are lacking, the fauna is poor and they are very much like Liassic sediments, with respect to the lithology. There are 3 references, all of which are Slavic.

AUTHOR: Slavin, V.I., Dobrynina, V.Ya. SOV-5-58-2-3/43

TITLE: The Stratigraphy of Jurassic Deposits of the L'vov Syncline and the Cis-Carpathian Marginal Depression (Stratigrafiya yurskikh otlozheniy L'vovskoy mul'dy i Predkarpatskogo kravevogo progiba)

PERIODICAL: Byulleten' Moskovskogo obshchestva ispytateley prirody - Otdel geologicheskoy, 1958, ³³Nr 2, pp 43-54 (USSR)

ABSTRACT: The author gives the results of recent research work on the Jurassic deposits of the L'vov syncline and the Cis-Carpathian depression, carried out in co-operation with the Geological Institute of the AS USSR. In this connection, the names of Soviet scientists, who devoted their studies to this subject are mentioned, such as A. Al't, F. Beniash, F. Stanislavskiy, P.A. Gerasimov and Ye.A. Gofman, N.R. Ladyzhnenskiy, Ya.M. Sandler, I.M. Yamnichenko, K. Voytsik, D. Keshmen, K. Glazevskiy, and S.I. Pasternak. The entire profile of the Jurassic deposits can be divided into three formations (see Figure 2): 1) the Sokal (Lias) formation consisting of sandy-argillaceous and carboniferous deposits; 2) the Rava-Russkaya (bat-Callovia) formation consisting of dolomite, gypsum, anhydrite and clay deposits, and 3) the Bukovina formation (Upper Jurassic period) consisting of limestone and marl deposits. A more detailed

SOV/20-120-3-50/67

TITLE:

On the Jurassic Marginal Downwarping of the Ciscarpathians and Dobruja (O yurskom Predkarpato-Dobruzhinskom krayevom peregibe)

PERIODICAL:

Doklady Akademii nauk SSSR, 1958, Vol. 120, Nr 3, pp.617-620 (USSR)

ABSTRACT:

The Russkaya platform is in the south bordered by the Predkarpatskiy marginal downwarping, which is of alpine age. This latter together with the corrugated mountains of the Carpathians turns to the south and departs from the platform. Hitherto the opinion has been held that east of this detachment the Russkaya platform is bordering the Mesozoic corrugated mountains of the Dobruja buried below the Neogene Prichernomorskaya depression. (Ref 2). In recent years Jurassic deposits with a thickness reaching 3500 m were found by drilling in the South Moldavia below the Neogene and partly below the Cretaceous layers, these deposits filling up the deep downwarping, which is pursued along the front of the fold of the North-Dobruja (Ref 1). Such deposits were

Card 1/3

SOV/20-120-3-50/67

On the Jurassic Marginal Downwarping in the Carpathians and Dobruja

also found by drilling below the Neogene of the Predkarpatskiy downwarping, which up to now could not be penetrated. From this it appears that it is possible to trace a narrow, however, deep marginal downwarping of Jurassic age along the border of the Russkaya platform from the Black Sea to the Polish border in a north west direction. Its width in Moldavia reaches 100 km, in front of the Carpathians on the latitude of L'vov from 60 to 80 km. In Romania on the meridian of Chernovtsy, the downwarping is narrowed down. It is very difficult to trace its south border, as it is covered. The north border takes its course from the mouth of the Dneestr, south of Kishinev, to Kaushany, in the Seret valley, further to Chernovtsy and Gorodenka. Farther west it merges with the Jurassic downwarping of the depression of L'vov, and it is difficult to draw a border line. The said downwarping represents an extensive formation of a regional order. It was formed previous to the late Hercynian Triassic fold system of the Dobrudzha, this process taking place at the end of the Triassic age or at the beginning of the Liassic time. It underwent the greatest downwarping during the Middle Jurassic age. Then the axis of the downwarping

Card 2/3

SOV/20-180-3-50/67

On the Jurassic Marginal Downwarping of the Ciscarpathians and Dobruja
(in Russian)

traveled north. Towards the end of the Jurassic age the downwarping ceased. Apart from the theoretical importance of the examination of the downwarping it also can be of practical importance, as bitumen, natural gases and salts may be connected with its sediments. There are 1 figure and 4 references which are Soviet.

TITLE: The Fourth Congress of the Carpatho-Balkan Association (IV s"yezd Karpato-Balkanskoy assotsiatsii)

PERIODICAL: Priroda, 1959, Nr 2, pp 104-105 (USSR)

ABSTRACT: In 1956, at the XXth session of the International Geological Congress, the activities of the Carpathian Association of Geologists were resumed for the first time in 27 years under the name of the Carpatho-Balkan Association. The renamed association convened for its IVth congress in Kiyev and L'vov from 16 to 29 May. The 255 participating geologists included delegations from Bulgaria, Hungary, Poland, Rumania, the CSR and the USSR. In Kiyev the chief problems were concerned with tectonics and the distribution of mineral resources. O.S. Vyalov - on behalf of the Organization Committee - delivered an extensive paper on those essentially correct ideas about the structure of the Carpathians which were conceived by Soviet researches for the past

The Fourth Congress of the Carpatho-Balkan Association

differ from the flysch of other regions, the head of the Polish delegation, Professor M. Książkiewicz, opposed vividly and pointed out the singularity of the Carpathian flysch. The head of the Rumanian delegation, Professor Filipescu, compared the black **chalk shale** of the Cretaceous and Paleogene periods of the East and West Carpathians. The congress decided on setting up permanently acting commissions of specialists in the fields of stratigraphy and paleogeography, tectonics, petrography and magmatism, mineralogy and geochemistry, hydrogeology and geological mapping. This close cooperation of the Carpatho-Balkan geologists permits the establishment of long-range scientific projects, such as the preparation of a stratigraphic dictionary of the Carpatho-Balkan Mountain Range, compilation of mineralogic and paleontologic handbooks on the Carpathians and the Balkan Mountains, the establishment of a standardized scheme of the Mesocenozoic era, a final determination of the role of overthrusts in the Car-

TITLE: Columnar Concretions in Bulgaria

PERIODICAL: Priroda, 1959, ¹⁶Nr 5, p 116 (USSR)

ABSTRACT: The author describes columnar concretions occupying about 20 km², situated 15 km west of Varna. The area resembles a site of excavations of an old town or a forest broken by a hurricane. The columns are up to 5 m high and 0.5 to 3 m in diameter. They are composed of calciferous sandstone containing foraminifera shells. Some of the columns are hollow inside, some bear cracks and some have already fallen to the ground. This phenomenon is described by S. Bonchev as a variety of stalactites formed by the infiltration of lime into the ~~strata of sand.~~

sons disclosed that the volume of Devonian deposits is more constant than that of hard coal. The author mentioned the following geologists who contributed to compiling this study: W. Teisseyre, M.M. Tetyayev, W. Zych, D.N. Sobolev, V. Unlig, G. Svidzinskiy, K. Tolvinskiy, M.V. Muratov, V.I. Slavin, T. Szalai, A.A. Bogdanov, O.S. Vyalov, V.G. Bondarchuk, N.S. Shatskiy, G.Kh. Dikenshteyn, D.P. Naydin, and P.L. Shul'ga. There are 3 maps and 19 references, 13 of which are Soviet, 3 Polish, 1 Hungarian, 1 French and 1 German.

ASSOCIATION: Moskovskiy gosudarstvennyy universitet imeni M.V. Lomonosova (Moscow State University imeni M.V. Lomonosov)

SUBMITTED: September 14, 1957.
